ACADEMIC POSITIONS

Assistant Professor of Marketing, <i>University of Colorado Boulder</i>	2020 – Present
Assistant Professor of Marketing, <i>Rotterdam School of Management</i>	2018 – 2020

EDUCATION

PhD, Marketing, <i>INSEAD Europe Campus</i> , cum laude	2018
MSc, Managerial and Financial Economics, <i>HEC Paris</i>	2012
BA, Management, <i>HEC Paris</i>	2009
BA, History of Arts, <i>Sorbonne Université</i>	2009

RESEARCH INTERESTS

Numerical and Managerial Cognition; Probabilistic Reasoning; Research and Statistical Methods

PUBLICATIONS

André, Quentin and Nicholas Reinholtz (2024), “Reducing Participant Costs Without Sacrificing Statistical Power in Consumer Research: An Introduction to Pre-Registered Interim Analysis Designs (PRIADs)”, *Journal of Consumer Research*
This paper introduces Pre-Registered Interim Analysis Designs (PRIADs): A practical five-step procedure to facilitate the adoption of group sequential designs in marketing. We show that these designs can be easily adopted by marketing researchers, and introduce a companion app to help researchers implement them. We demonstrate multiple benefits of PRIADs for researchers: They facilitate sample size decisions, allow researchers to achieve a desired level of statistical power with a smaller number of observations, and help conduct more efficient pilot studies. We validate this cost-saving potential through a re-analysis of 212 studies published in the Journal of Consumer Research, which shows that using PRIADs would have reduced participant costs by 20% to 29%.

Paolacci, Gabriele and Quentin André (2023), “Probabilistic Outcomes Are Valued Less in Expectation, Even Conditional on Their Realization”, *Management Science*

Most theories of decision-making under risk assume that payoffs and probabilities are separable: In the context of a lottery, the subjective value of a prospective outcome (the payoff) is assumed to be independent of the likelihood that the outcome will occur (the probability). In violation of this assumption, we present 8 experiments showing that people anticipate less utility from uncertain outcomes than from certain outcomes. The devaluation of uncertain outcomes is observed across different measures of utility (willingness to spend money or time; choice between different options), different populations (student and online samples), and different manipulations of uncertainty. We show that this result does not simply reflect a misunderstanding of the instructions, or people's aversion towards "weird" transaction with unexplained features. We highlight the implications of this phenomenon for empirical investigations of risk preferences, and conclude with a discussion of the psychological mechanisms that might drive the devaluation of uncertain outcomes in lottery contexts.

André, Quentin, Nicholas Reinholtz, and Bart de Langhe (2022), "Can Consumers Learn Price Dispersion? Evidence for Dispersion Spillover Across Categories", *Journal of Consumer Research*

This paper examines consumers' ability to form accurate beliefs about the minimum, the maximum, and the overall variability of prices for multiple product categories. Eight experiments provide evidence for a novel phenomenon we call dispersion spillover: Consumers tend to overestimate price dispersion in one category after encountering another category in which prices are more dispersed. This dispersion spillover is consequential: It influences the likelihood that consumers search for (and find) better prices and offers, and how much consumers bid in auctions. We disentangle two cognitive processes that might underlie dispersion spillover, and show that it does not simply reflect the inappropriate activation of prices from other categories. Instead, it appears that consumers also form "intuitive statistics" of dispersion: Summary representations that encode the dispersion of prices in the environment, but that are insufficiently category-specific.

André, Quentin (2022) "Outlier Exclusion Procedures Must be Blind to the Researcher's Hypothesis", *Journal of Experimental Psychology: General*

When researchers choose to identify and exclude outliers from their data, should they do so across all the data, or within experimental conditions? Both methods are widely used, and common data visualization techniques suggest that outliers should be excluded at the condition-level. In this paper, I highlight that removing outliers by condition runs against the logic of hypothesis testing. I show in simulated experiments, and in a re-analysis of existing data, that by-condition exclusions can result in false-positive rates as high as 43%. I finally demonstrate that by-condition exclusions are a specific case of a more general issue: Any outlier exclusion procedure that is not blind to the hypothesis that researchers want to test may result in inflated Type I errors. I conclude by offering best practices and recommendations for excluding outliers.

André, Quentin and Bart de Langhe (2022), "How (Not) To Test Theory with Data: Illustrations from Walasek, Mullett and Stewart", *Journal of Experimental Psychology: General*

In a response to André and de Langhe (2021), Walasek, Mullett and Stewart (2020) defend the link between decision by sampling and loss aversion. We take their response as an opportunity to emphasize three guiding principles when testing theory with data: 1) Look for data that are uniquely predicted by the theory, 2) Do not ignore data that contradict the theory, and 3) If an experiment is flawed, fix it. In light of these principles, we do not believe that Walasek, Mullett, and Stewart (2020) provide new insights about the origin and stability of loss aversion.

André, Quentin and Bart de Langhe (2022), “No Evidence for Loss Aversion Disappearance and Reversal in Walasek and Stewart (2015)”, *Journal of Experimental Psychology: General*
In an influential article published in the Journal of Experimental Psychology: General, Walasek and Stewart (2015) test an implication of decision by sampling theory: Loss aversion can disappear, and even reverse, depending on the distribution of gains and losses people have encountered. In this article, we show that the results reported in Walasek and Stewart (2015) emerge because the estimates of loss aversion are computed on different lotteries in different conditions. After correcting this error, we do not see evidence that loss aversion is shaped by the distribution of gains and losses that people have encountered.

André, Quentin, Pierre Chandon, and Kelly H. Haws (2019), “Healthy Through Presence or Absence, Nature or Science?: A Framework for Understanding Front-of-Package Food Claims”, *Journal of Public Policy and Marketing*
Consumers intuitively categorize front-of-packaging claims displayed on food into 4 broad categories: (1) Claims about “removing negatives,” (e.g., “Low Fat”), (2) claims about “adding positives,” (e.g., “High vitamins”), (3) claims about “not adding negatives” (e.g., “GMO-free”), and (4) claims about “not removing positives” (e.g., “Unprocessed”). Each type of claim is associated with different beliefs about the healthiness, tastiness, and dieting properties of the food.

André, Quentin, Ziv Carmon, Klaus Wertenbroch, Alia Crum, Douglas Frank, William Goldstein, Joel Huber, Leaf van Boven, Bernd Weber and Haiyang Yang (2018), “Consumer Choice and Autonomy in the Age of Artificial Intelligence and Big Data”, *Customer Needs and Solutions*
Drawing on diverse perspectives from marketing, economics, philosophy, neuroscience, and psychology, we explore how consumers’ sense of autonomy in making choices affects their well-being. We discuss how new technologies may enhance or diminish consumers’ perceptions of being in control of their choices and how feelings of control (or lack thereof) affect consumers’ well-being. We suggest avenues for future research in the domain of choice, well-being, and consumer welfare.

WORKING PAPERS

André, Quentin and Bart de Langhe, “Everyone’s a Genius in a Bull Market: How Exogenous Trends Lead to Overconfidence” (*in preparation for second round submission at Management Science*)

To achieve success, managers and executives must develop an accurate understanding of how predictive business cues (e.g., the features of advertising campaigns) relate to desirable outcomes (e.g., their return on ad spend). One of the factors that complicate learning is the presence of exogenous trends: Improvement or worsening in the quality of the outcomes over time, independently of the decision makers’ actions (e.g., driven by business cycles). We offer a learning model describing how these positive exogenous trends would shape stronger yet less accurate beliefs in how cues relate to outcomes. Specifically, we show that since decision makers evaluate the quality of a focal outcome by comparing it to its historical performance, and since decisions makers tend to learn from alternatives they believe will result in better outcomes, any exogenous factor that improves outcomes over time will appear to “validate” the decision makers’ current beliefs about cue-outcome relationships, regardless of their accuracy. We support the predictions of this model through interactive cue-learning experiments involving diverse participants, including simulated agents, MTurk workers, students, and senior executives.

Ziani, Zoé and Quentin André, “Does Networking Make People Feel “Dirty”? Reconsidering the Evidence in Casciaro, Gino, Kouchaki (2014)” (*under second round review at Administrative Science Quarterly*)

In 2014, Casciaro, Gino, and Kouchaki published an influential paper for our understanding of networking behaviors. The paper’s core claim is that people dislike networking because it triggers a state of “moral impurity,” which then leads people to feel “psychologically dirty.” The paper presented two laboratory experiments in support of this claim, showing that thinking about networking i) facilitates the mental accessibility of cleansing-related concepts and ii) increases the desirability of cleansing products. Our manuscript presents theoretical, methodological, and empirical challenges to this claim. On the theoretical side, we argue that the concept of “psychological dirtiness” is imprecisely and contradictorily defined; and remind that there is little evidence of a link between moral purity and desire for cleansing. On the methodological side, we highlight confounded dependent measures and a non-orthogonal design in one of the original studies. On the empirical side, we present three pre-registered high-powered replication attempts of studies of the original paper, in which we find no evidence that networking (or other moral violations) increases the accessibility of cleansing-related concepts or the desirability of cleansing products. We conclude that “psychological dirtiness” is not the appropriate framework to understand the nature of networking discomfort, and suggest future research directions.

Naborn, Jay, Quentin André, Hannah Perfecto, Sam Hirshman, and Nicholas Reinholtz, “Would you Buy a South-Pointing Compass? People Underestimate the Informativeness of Negatively Correlated Preferences” (*in preparation for resubmission*)

If you had to decide about which movie to watch, which product to purchase, or which policy to vote for, would you rather ask a friend you systematically disagree with, or one you often agree with? Our experiments show that people systematically undervalue “south-pointing compasses”:

Sources of information that have a strong negative correlation with their own preferences. Instead, they prefer to rely on information that is weakly correlated with their own preferences, and therefore less informative. We show that this bias is robust to different paradigms (decisions from description and decisions from experience), different decision domains (political choices, movie choices, and abstract stimuli), and different tasks (accept and reject).

André, Quentin, Bart de Langhe, and Philip Fernbach, “Hipsters and Hillbillies: The Perils of Personas” (*reject and resubmit at the Journal of Marketing*)

Market segmentation entails a number of data-driven steps (e.g., choosing variables, collecting data, identifying clusters in the data, summarizing their properties), which are then followed by sense-making efforts through statistical segments are interpreted and understood. We find that two common sense-making techniques – choosing descriptive segment names and generating “personas” – on people’s perception of consumer segments. lead people to amplify the differences between segments (“amplification”) and to compress the differences within segments (“compression”). We discuss the implication of our results for marketing practice and suggest possible interventions to mitigate these biases.

André, Quentin, Nicholas Reinholtz, and John G. Lynch Jr., “Restricted-Use Funds and Budgeting Decisions” (*on hold*)

How do consumers budget when a part of their income is denominated in a category-restricted resource (e.g., food stamps)? Building on the mental accounting and categorization literature, we hypothesized that people endowed with a category-restricted resource would be averse to spending their unrestricted money on products of this category. To test this hypothesis, we developed a multi-round, interactive budgeting simulation. We find that people endowed with a food-restricted resource end up budgeting less on food than people who received an equivalent amount in unrestricted money.

CONFERENCES AND INVITED PRESENTATIONS

1. The University of Oklahoma, Oklahoma, November 2024
“Everyone’s a Genius in a Bull Market: How Exogenous Trends Foster Illusory Learning” (Invited Presentation)
2. Association for Consumer Research Conference, France, October 2024
“Pre-Registered Interim Analysis Plans” (Workshop)
“Rigor in Research” (Doctoral Symposium)
3. INSEAD Behavioral Insights Summit, France, October 2024
“Everyone’s a Genius in a Bull Market: How Exogenous Trends Foster Illusory Learning” (Invited Presentation)
4. Behavioral Decision Research in Management Conference, Illinois, June 2024
“Everyone’s a Genius in a Bull Market: How Exogenous Trends Foster Illusory Learning” (Session Paper)
5. The Wharton School, University of Pennsylvania, Pennsylvania, March 2023

- “Everyone’s a Genius in a Bull Market: How Exogenous Trends Foster Illusory Learning” (Invited Presentation)*
6. Society for Personality & Social Psychology – JDM Preconference, Georgia, February 2023
“People Underestimate the Informativeness of Negatively Correlated Preferences” (Invited Presentation)
 7. Association for Consumer Research Conference, Colorado, October 2022
“People Underestimate the Informativeness of Negatively Correlated Preferences” (Session Chair)
 8. HEC Montreal, Canada, April 2022
“A Critical Perspective on Effect Sizes in Marketing” (Invited Presentation)
 9. University of Bath, United Kingdom, March 2022
“People Underestimate the Informativeness of Negatively Correlated Preferences” (Invited Presentation)

27. Transformative Consumer Research Conference (ACR), France, May 2013
“Low-Income Consumers” (Discussant)

SOFTWARE AND STATISTICAL LIBRARIES

PRIApp

An interactive web app to facilitate the adoption of Pre-Registered Interim Analysis Plans (PRIADs), available at <https://priadconsumerresearch.shinyapps.io/PRIApp/>

pypcurve: A library for p-curve analysis in Python

A Python implementation of Simonsohn, Simmons and Nelson's 'p-curve', available at <https://quentinandre.net/software/pypcurve/>

Sloppy Learning

A series of experimental paradigm showing how exogenous trends foster illusory learning, developed for André and de Langhe (working paper). Written in React, Redux and Flask. Used to illustrate learning traps in MBA and EMBA classes at ESADE, KU Leuven, RSM, and CU Boulder.

distBuilder: A Javascript library to add distribution builders to online and offline experiments

Open-source implementation of the distribution builder method described in Goldstein and Rothschild (2014). Documentation and source code available at <https://quentinandre.github.io/software/distributionbuilder/> (includes a ready-to-use Qualtrics implementation)

pyprocessmacro: A Python 3 library to estimate moderation, mediation, and conditional processes

*Open-source rewrite of Andrew F. Hayes' "Process Macro" in Python
Documentation and source code available at
<https://quentinandre.net/software/pyprocessmacro/>*

pypsprite: A Python 3 re-implementation of 'Sample Parameter Reconstruction via Iterative TEchniques (SPRITE)' (Heathers et al. 2018)

*Documentation and source code available at
<https://github.com/QuentinAndre/pypsprite/>*

affectiveSamplerJS: A Javascript library to record people's affective reactions to audio/video sequences

*Documentation and source code available at
<https://github.com/QuentinAndre/AffectiveSamplerJS/>*

wordSearchJS: A Javascript library to add word search tasks to online and offline experiments

*Documentation and source code available at
<https://github.com/QuentinAndre/WordSearchJS/>*

HONORS AND GRANTS

Dean's Faculty Scholar Award, CU Boulder, 2024

Winner of the ADL Partner PhD Award, 2017

Fellow, AMA-Sheth Doctoral Consortium, Mendoza College of Business, University of Notre Dame, Indiana, 2016

Full tuition scholarship, INSEAD, 2013-2018

TEACHING

Undergraduate and Graduate Level

Marketing Management (MBA Core), 2020-Present, CU Boulder

Fundamentals of Data Analytics (M.Sc.), 2024-Present, CU Boulder

Brand Development (M.Sc.), 2019-2020, Rotterdam School of Management

Ph.D. Seminars

Experimental Methods, 2019-2020, Rotterdam School of Management

Guest Ph.D. Lectures

Power and Effect Sizes, 2024, New York University

Teaching Assistant

Brand Management (MBA Elective), Pierre Chandon, 2015-2017

Adjunct Lecturer Positions

Preparation to Business School Interviews, IPECOM Paris, 2008-2013

History of Economic Theory, IPECOM Paris, 2008-2010
